
Iterations

Iteration #1 – UX Design

✧ Personas

- Present only the Persona for your module

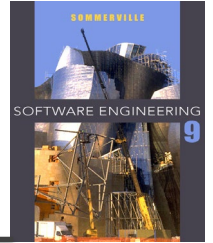

✧ Fully Functional UI Design implemented in Balsamiq

- No functionality behind the UI is required

Iteration #2 – Sub-System Demonstration

- ✧ The modules shall have a full UI implementation.
- ✧ The modules shall have a test interface with inputs and outputs.
- ✧ Modules are as functional as possible – prioritize appropriately
 - CTC can dispatch a train to one of the stations and indicate block occupancy
 - Track Controller can move a switch
 - PLC language should be defined but need not be fully implemented
 - Track Model can read in track configuration & indicate occupancy
 - Train Model can move based on power command
 - Train Controller can regulate speed

Iteration #2 – Sub-System Blue Line

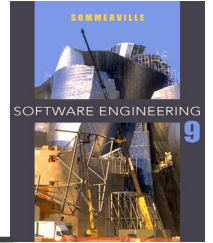

- ✧ Prototype track – Y with 15 blocks, one switch, two station at the end of the Y

Iteration #3 – System Demonstration

- ✧ Demonstrate the fully integrated system with as much of the module internals implemented as possible
- ✧ Focus on the use case
 - Track Model reads in green line and shows track occupancy
 - CTC dispatches a Train to a Station
 - Driver changes speed in manual mode
 - Train model moves as appropriate
 - Track controller should be moving switches using a PLC program written by Track Engineer

Iteration #4 – Final System Presentation

✧ Full system should be working
